```
  window.__MASTER_STIPPLE__ = stipple;
}

// call every frame
function updateStippleFace(State, timeSec) {
  const s = window.__MASTER_STIPPLE__;
  if (!s || !window.MASTER_FACE_STIPPLE) return;
  window.MASTER_FACE_STIPPLE.syncFromFaceState(s.material, State);
  window.MASTER_FACE_STIPPLE.tick(s.material, timeSec);
}
```

Hook `mountStippleFace` next to scene setup, `updateStippleFace` next to your existing face step.

That's the full integration path: files on disk, load order, one-time mount, per-frame sync, playground, and peaceful coexistence with ParticleKernel. Once that runs, replace `createDefault` samples with your real face topology and lock values into `tokens.yml`.
